Preface

MVME761 Transition Module Installation and Use provides general information, hardware preparation, installation instructions and support information for the MVME761-001 and MVME761-011 Transition Modules.

The MVME761-0x1 Transition Module is used as the interface between the following host VMEmodules and various peripheral devices:

MVME2603-1121 to 1161	MVME2700-1421 to 1461
MVME2603-3121 to 3161	MVME2700-3221 to 3261
MVME2604-1321 to 1361	MVME2700-3321 to 3361
MVME2604-3321 to 3371	MVME2700-3421 to 3461
MVME2700-1221 to 1261	MVME3604-5342 to 5372
MVME2700-1321 to 1361	MVME4604-5342 to 5372

An MVME2600/MVME2700/MVME3600/MVME4600 module that is designed for use with an MVME712M Transition Module will be damaged if you use it with an MVME761-0x1 Transition Module.

This manual is intended for anyone who wants to design OEM systems, supply additional capability to an existing compatible system, or for use in a lab environment for experimental purposes.

A basic knowledge of computers and digital logic is assumed.

To use this manual you should be familiar with the publications listed in [Related Documentation](#).

Related Documentation

The publications listed below are referenced in this document. To purchase manuals you may contact Motorola in these ways:

- ❑ Through your local Motorola sales office
- ❑ By contacting the Literature Center via phone or fax at the numbers listed under Product Literature at MCG's World Wide Web site, <http://www.mcg.mot.com/literature>.

MVME2700 Single Board Computer Installation and Use	V2700A/IH
MVME3600/4600 Series VME Processor Module Installation and Use	V36V46A/IH
MVME3600/4600 Series VME Processor Module Programmer's Reference Guide	V36V46A/PG

Each Motorola Computer Group manual publication number is suffixed with characters that represent the revision level of the document, such as /IH2 (second revision).

To obtain the most up-to-date product information in PDF or HTML format, visit our Web site at <http://www.mcg.mot.com/literature>.

Summary of Changes

Change Date	Description
5/14/99	Updated VME board model numbers in <i>Preface</i> and <i>General Description</i> sections.
5/14/99	Added pinout information for P2 adapter cards. Table 4-8 and Table 4-11 .
5/14/99	Updated Related Documentation table.
4/9/99	Corrected transition module cable part numbers in Table 1-5 .
4/9/99	Added VME4600 board support
4/9/99	Updated all port 3 and 4 configuration drawings

Safety Summary

Safety Depends On You

The following general safety precautions must be observed during all phases of operation, service, and repair of this equipment. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the equipment. Motorola, Inc. assumes no liability for the customer's failure to comply with these requirements.

The safety precautions listed below represent warnings of certain dangers of which Motorola is aware. You, as the user of the product, should follow these warnings and all other safety precautions necessary for the safe operation of the equipment in your operating environment.

Ground the Instrument.

To minimize shock hazard, the equipment chassis and enclosure must be connected to an electrical ground. The equipment is supplied with a three-conductor ac power cable. The power cable must be plugged into an approved three-contact electrical outlet. The power jack and mating plug of the power cable meet International Electrotechnical Commission (IEC) safety standards.

Do Not Operate in an Explosive Atmosphere.

Do not operate the equipment in the presence of flammable gases or fumes. Operation of any electrical equipment in such an environment constitutes a definite safety hazard.

Keep Away From Live Circuits.

Operating personnel must not remove equipment covers. Only Factory Authorized Service Personnel or other qualified maintenance personnel may remove equipment covers for internal subassembly or component replacement or any internal adjustment. Do not replace components with power cable connected. Under certain conditions, dangerous voltages may exist even with the power cable removed. To avoid injuries, always disconnect power and discharge circuits before touching them.

Do Not Service or Adjust Alone.

Do not attempt internal service or adjustment unless another person capable of rendering first aid and resuscitation is present.

Use Caution When Exposing or Handling the CRT.

Breakage of the Cathode-Ray Tube (CRT) causes a high-velocity scattering of glass fragments (implosion). To prevent CRT implosion, avoid rough handling or jarring of the equipment. Handling of the CRT should be done only by qualified maintenance personnel using approved safety mask and gloves.

Do Not Substitute Parts or Modify Equipment.

Because of the danger of introducing additional hazards, do not install substitute parts or perform any unauthorized modification of the equipment. Contact your local Motorola representative for service and repair to ensure that safety features are maintained.

Dangerous Procedure Warnings.

Warnings, such as the example below, precede potentially dangerous procedures throughout this manual. Instructions contained in the warnings must be followed. You should also employ all other safety precautions which you deem necessary for the operation of the equipment in your operating environment.

Dangerous voltages, capable of causing death, are present in this equipment.
Use extreme caution when handling, testing, and adjusting.

This equipment generates, uses, and can radiate electromagnetic energy. It may cause or be susceptible to electromagnetic interference (EMI) if not installed and used in a cabinet with adequate EMI protection.

European Notice: Board products with the CE marking comply with the EMC Directive (89/336/EEC). Compliance with this directive implies conformity to the following European Norms:

EN55022 (CISPR 22) Radio Frequency Interference

EN50082-1 (IEC801-2, IEC801-3, IEEC801-4) Electromagnetic Immunity

The product also fulfills EN60950 (product safety) which is essentially the requirement for the Low Voltage Directive (73/23/EEC).

This board product was tested in a representative system to show compliance with the above mentioned requirements. A proper installation in a CE-marked system will maintain the required EMC/safety performance.

Introduction

This manual provides general information, hardware preparation, installation instructions, and a functional description for the MVME761-001 and MVME761-011 Transition Modules.

Product Overview

The MVME761-0x1 Transition Module provides the interface between the MVME260x, MVME270x, MVME360x, or MVME460x Single Board Computer VME module and various peripheral devices. This module provides industry standard connectors to simplify customer cable requirements for the serial port, printer, and Ethernet signals.

Features

The features of the MVME761-0x1 Transition Module include:

- ❑ Industry-standard connectors for these interfaces:
 - Two EIA-574 asynchronous serial ports (DTE)
 - Two asynchronous/synchronous serial ports, which can be configured for EIA-232-D, EIA-530, V.35, or X.21 interfaces (DCE or DTE)
 - One parallel port (IEEE Standard 1284-I compliant)
 - 10Base-T/100Base-TX Ethernet
- ❑ Two 60-pin Serial Interface Module (SIM) connectors for configuring the asynchronous/synchronous serial ports
- ❑ Single-width board
- ❑ Electro-Magnetic Interference (EMI) and Electro-Static Discharge (ESD) protection

General Description

The MVME761-0x1 Transition Module provides the interface between the standard Ethernet, parallel port, and the serial port connectors, and the following MVME260x, MVME270x, MVME360x, and MVME460x Single Board Computer VME modules:

MVME2603-1121 to 1161	MVME2700-1421 to 1461
MVME2603-3121 to 3161	MVME2700-3221 to 3261
MVME2604-1321 to 1361	MVME2700-3321 to 3361
MVME2604-3321 to 3371	MVME2700-3421 to 3461
MVME2700-1221 to 1261	MVME3604-5342 to 5372
MVME2700-1321 to 1361	MVME4604-5342 to 5372

All port I/O controllers reside on the MVME260x, MVME270x, MVME360x, and MVME460x Single Board Computer modules. The MVME761 transition module Ethernet and parallel port circuitry is passive. The serial port circuitry provides multiplexing and buffering functions (refer to [P2 Signal Multiplexing \(P2MX\)](#) on page 3-4). The multiplexing function is transparent to the user.

Both MVME761-0x1 models use the same transition module. The MVME761-001 comes with a P2 adapter that connects to a 3-row DIN chassis backplane. The MVME761-011 comes with a P2 adapter that connects to a 5-row DIN chassis backplane.

[Figure 1-1](#) shows the MVME761 transition module component layout and the front panel. See [Table 1-2](#) for a list of the front panel port connectors.

Figure 1-1. MVME761 transition module front panel and component side

Serial Port Interface Modules

You may configure the asynchronous/synchronous serial ports (ports 3 and 4) to the appropriate interface by installing a Serial Interface Module (SIM). A SIM is a small “plug-in” printed circuit board that converts the TTL-level synchronous or asynchronous port signals to industry standard voltage levels used by the ports. The SIM contains the receiver and transmitter circuits for converting the input and output signals of the host VME module to the appropriate serial data communication protocol.

The SIMs for the MVME761-0x1 are listed in the following table.

Table 1-1. SIM part numbers

Interface	Model Number	Part Number
EIA-232-D DCE	SIM232DCE	01-W3876B01B
EIA-232-D DTE	SIM232DTE	01-W3877B01A
EIA-530 DCE	SIM530DCE	01-W3878B01B
EIA-530 DTE	SIM530DTE	01-W3879B01B
V.35 DCE	SIMV35DCE	01-W3128F01A
V.35 DTE	SIMV35DTE	01-W3127F01A
X.21 DCE	SIMX21DCE	01-W3167F01B
X.21 DTE	SIMX21DTE	01-W3166F01A

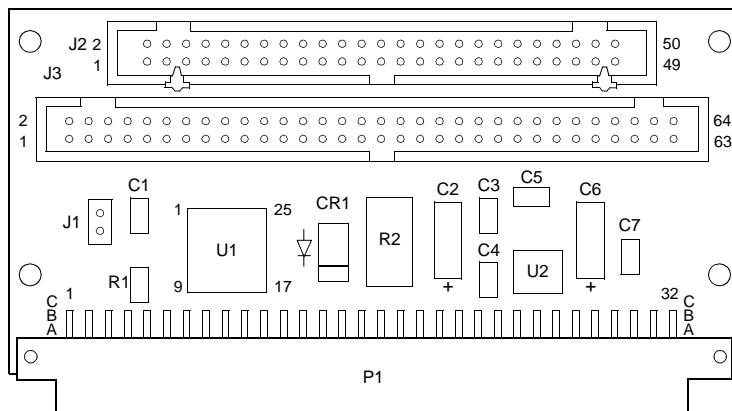

Note Additional SIMs may be released. Please see your Motorola representative for a complete list of SIMS that are available for the MVME761-0x1.

P2 Adapter Boards

The P2 adapters route the asynchronous and synchronous port, printer port, and Ethernet signals to the MVME761 transition module.

Three-row P2 adapter (MVME761-001)

The P2 adapter for the MVME761-001 mounts onto a 3-row, 96-pin P2 backplane connector. The 50-pin male connector, J2, carries the 8-bit SCSI signals from the MVME260x, MVME270x, MVME360x, or MVME460x. To run SCSI devices, you may install an additional transition module that is equipped with a SCSI port, such as the MVME712B.

1933 9610

Figure 1-2. 3-row DIN backplane P2 adapter (MVME761-001)

This P2 adapter, and the cable for connecting to the MVME761 transition module, can be ordered separately as model MVME761P2-001.

Five-Row P2 adapter (MVME761-011)

The P2 adapter for the MVME761-011 mounts onto a 5-row, 160-pin P2 backplane connector. The 68-pin female connector, J1, carries 16-bit SCSI signals from the MVME260x, MVME270x, MVME360x, or MVME460x. It also has a 64-pin male connector, J3, for PMC I/O.

1999 9701

Figure 1-3. 5-row DIN backplane P2 adapter (MVME761-011)

This P2 adapter, and the cable for connecting to the MVME761 transition module, can be ordered separately as model MVME761P2-011.

Connectors and Cables

The connectors on the MVME761 transition module and the P2 adapters are listed in the following tables. The port connectors are located on the front panel, which is shown in [Figure 1-1](#). See [Table 1-5 on page 1-8](#) for a list of the cables. See [Chapter 4](#) for the connector pin assignments.

The cable used for connecting the MVME761 transition module to the P2 adapter is provided with the MVME761-0x1. You will need to purchase or fabricate the port cables.

Table 1-2. MVME761 transition module connectors

Type	Number	Description
COM1 and COM2	J5 J6	9-pin male DIN asynchronous serial port connector
Serial port 3 Serial port 4	J7 J8	26-pin female HD-26 synchronous serial port connector
Parallel port	J4	36-pin female parallel port connector
10Base-T, 100Base-TX	J9	8-pin female RJ-45 Ethernet port connector
SIM	J1, J12	60-pin female connector
VME	P2	64-pin male connector to J2 on the P2 adapter

Table 1-3. 3-Row P2 adapter connectors (MVME761-001)

Type	Number	Description
VME	P1	96-pin female DIN 41612 connector to the chassis backplane
	J3	64-pin male connector for output to P2 on the MVME761 transition module
SCSI	J2	50-pin male IDC connector for internal SCSI devices

Table 1-4. 5-Row P2 adapter connectors (MVME761-011)

Type	Number	Description
VME	P1	160-pin female DIN 41612 connector to the chassis backplane
	J4	64-pin male connector for output to P2 on the MVME761 transition module
PMC I/O	J3	64-pin male connector for PMC I/O
SCSI	J1	68-pin female IDC connector for internal SCSI devices

Table 1-5. MVME761 transition module cables

Part Number	Description
Included with the MVME761-0x1	64-line flat ribbon cable with 96-pin DIN connectors that connects P2 on the MVME761 transition module to J3 on the 3-row P2 Adapter or J4 on the 5-row P2 adapter; 13 inches long. (30-W2799B02A).
User-supplied	EIA-232-D DTE or DCE cable (pins used depend on the processor VME module)
User-supplied	Centronics- type parallel printer cable, male-to-male
User-supplied	20-conductor cable; usually supplied with the modem
User-supplied	6-conductor cable; usually supplied with the modem
CBL761HD26DB25	Straight-through adapter cable with female HD-26 connector and male DB-25 connector, 3 feet long. (30-NW9302B27)
Note	If you supply your own 64-line cable to connect the P2 adapter to the MVME761 transition module, the cable should not be longer than 1.5 feet. A longer cable is likely to cause problems, especially for the Ethernet and parallel port signals.

Specifications

The MVME761 transition module specifications are shown in [Table 1-6](#).

Table 1-6. MVME761-0x1 specifications

Characteristics	Specifications
Power Requirements	+12Vdc, 100mA typical, 200mA maximum -12Vdc, 100mA (for some of the SIMs)
Operating temperature	0° to 55° C at chassis point of entry of forced air (approximately 5 CFM)
Storage temperature	-40° to +85° C
Relative Humidity	5% to 90% (non-condensing)
Board Size (excluding front panel)	Height: 9.187 inches(233.35 mm) Height: 3.200 inches(80.00 mm) Thickness: 0.063 inches (1.60 mm)

Cooling requirements

The MVME761-0x1 is tested to operate under forced air cooling with an incoming air temperature range of 0 degrees C to 55 degrees C. Adequate cooling can be achieved with air flowing over the module at 5 cubic feet per minute. The exact amount of airflow required for cooling depends on the ambient air temperature and the type, number, and location of modules and other heat sources.

FCC compliance

The MVME761-0x1 was tested in an FCC-compliant chassis, and meets the requirements for Class A equipment. For minimum RF emissions, it is essential that you implement the following conditions:

- ❑ Install shielded cables on all external I/O ports
- ❑ Connect conductive chassis rails to earth ground to provide a path for connecting shields to earth ground
- ❑ Tighten all front panel screws

Hardware Preparation and Installation

2

Introduction

This chapter provides unpacking instructions, hardware preparation, and installation instructions for the MVME761 transition module, the P2 adapter, and the Serial Interface Modules.

Unpacking the Hardware

Use ESD

Wrist Strap

The MVME761-0x1 is packed in an antistatic wrapper to protect it from static discharge. Motorola strongly recommends that you use an antistatic wrist strap and a conductive foam pad when handling the equipment. Electronic components can be extremely sensitive to electrostatic discharge (ESD). After removing the board from the protective wrapper, place it component side up on a grounded, static-free surface. Do not slide the board over any surface.

Unpack the equipment from the shipping carton. Refer to the packing list and verify that all items are present. Save the packing material for storing and reshipping of the equipment.

Installing the Serial Interface Modules

Configure the serial ports 3 and 4 for the required interface by installing the appropriate SIM. See [Table 1-1 on page 1-4](#) for a list of the serial port interface types.

Prior to installing the SIMs, set the jumpers on header J2 (for serial port 3) and header J3 (for serial port 4) for either DCE or DTE. Set the jumper to position:

- ❑ 1-2 if the SIM is for a DTE interface
- ❑ 2-3 if the SIM is for a DCE interface

11650 9610

Figure 2-1. Serial port interface jumper settings

Note You must set the jumpers and install the SIMs prior to installing the MVME761 transition module in the system chassis.

The SIMs plug into connector J1 (for serial port 3) or J12 (for serial port 4) on the MVME761 transition module.

Install the SIMs on the MVME761 transition module per the following procedure:

1. Align the SIM so that P1 on the SIM lines up with the appropriate SIM connector (J1 for serial port 3 or J12 for serial port 4) on the transition module. Note the position of the alignment key on P1. See [Figure 2-2](#).

Figure 2-2. Serial interface module and connector P1

2. Place the SIM onto the transition module SIM connector, making sure that the mounting holes also line up with the standoffs on the transition module as shown in [Figure 2-3](#).
3. Gently press the top of the SIM to seat it on the transition module SIM connector. If the SIM does not seat with gentle pressure, re-check the alignment of the connectors.

Note Do not force the SIM onto the transition module.

4. Secure the SIM to the transition module standoffs with the two Phillips-head screws provided. Do not over tighten the screws.

1911 9609

Figure 2-3. Installing a SIM onto the MVME761 transition module

Installing the Transition Module and P2 Adapter

Install the MVME761 transition module and P2 adapter in the system chassis. The P2 adapter is required because the P2 connector on the transition module is not compatible with the P2 connector on the chassis backplane.

Use ESD

Wrist Strap

Motorola strongly recommends that you use an antistatic wrist strap and a conductive foam pad when installing boards in a system chassis. Electronic components, such as disk drives, computer boards, and memory modules, can be extremely sensitive to ESD. Place the board flat on a grounded, static-free surface, component-side up. Do not slide the board over any surface.

If an ESD station is not available, you can avoid damage resulting from ESD by attaching the ESD wrist strap to an unpainted metal part of the system chassis.

Install the MVME761-0x1 in the system chassis per the [Procedure on page 2-6](#). Refer to [Figure 2-4](#), which shows the cabling and connections within the chassis.

Caution

An MVME2600/MVME2700/MVME3600/MVME4600 module that is designed for use with an MVME712M Transition Module will be damaged if you use it with an MVME761-0x1 Transition Module.

Caution

Connecting modules while power is applied may result in damage to components on the module.

Warning

Dangerous voltages, capable of causing death, are present in this equipment. Use extreme caution when handling, testing, and adjusting.

11654.00 9610

Figure 2-4. MVME761-0x1 chassis connections

Procedure

1. Turn all equipment power OFF and disconnect the power cable from the AC power source.
2. Remove the chassis cover per the instructions in the equipment user's manual.
3. If the chassis has a rear card cage, remove the filler panel(s) from the appropriate card slot(s) at the rear of the chassis.

4. If necessary, move some of the other modules to allow space for the cables connected to the P2 adapter and the transition module.
5. Install the jumper on header J1 (on the 3-row P2 adapter or header J5 on the 5-row P2 adapter) if you are supporting SCSI devices.
6. Attach the P2 adapter, for either the 3-row or 5-row version, to the backplane connector that is directly in line with the P2 connector on the MVME260x, MVME270x, MVME360x, or MVME460x.

Note Be sure to orient pin 1 of the P2 adapter's connector with pin 1 of the backplane connector.

7. Attach the 64-conductor cable (furnished with the MVME761-0x1) to the P2 adapter (J3 on the 3-row version, J4 on the 5-row version). Be sure to orient cable pin 1 with connector pin 1.
8. Attach the 64-conductor cable to connector P2 on the transition module. Be sure to orient cable pin 1 with connector pin 1.
9. Insert the transition module into the chassis slot, and tighten the attaching screws.

Note Make sure there is good contact with the transverse mounting rails in order to minimize RF emissions.

10. Install the chassis cover, making sure that cables are not pinched by the cover.
11. Connect the power cable to the AC power source.

Introduction

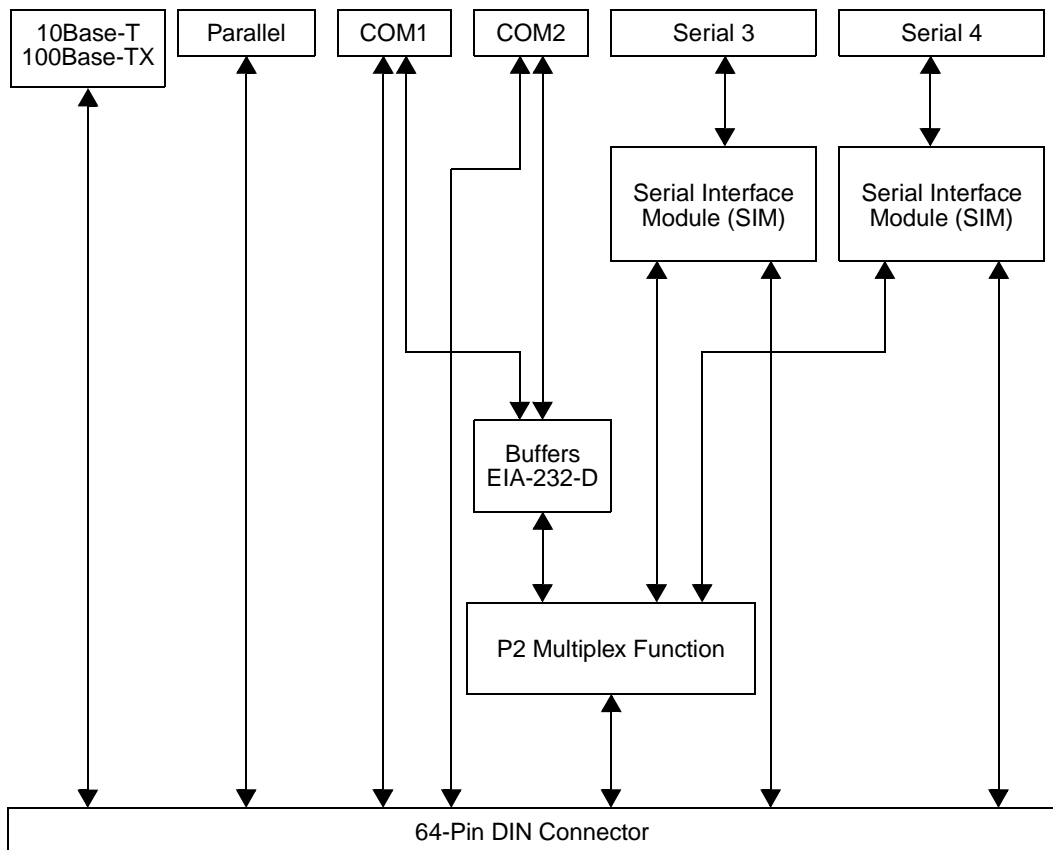

This chapter provides information on MVME761 transition module and SIM circuitry, P2 signal multiplexing, and the configuration of the serial ports.

Circuitry

The MVME761 transition module and the Serial Interface Modules (SIMs) convert the TTL level signals to and from the MVME260x, MVME270x, MVME360x, and MVME460x modules to the reception and transmission levels specified by the appropriate port interface standard.

The MVME761 transition module contains a small amount of “house keeping” circuitry. Bulk capacitors are on the power sources (+5Vdc, +12Vdc, and -12Vdc). Pullup resistors put the inputs to the MVME260x, MVME270x, MVME360x, and MVME460x in a known high even when no SIM is installed.

The block diagram for the MVME761 transition module is shown in [Figure 3-1](#). The block diagram for the 3-row DIN backplane P2 adapter is shown in [Figure 3-2](#). The block diagram for the 5-row DIN backplane P2 adapter is shown in [Figure 3-3](#).

P2 Signal Multiplexing (P2MX)

Because of a limited number of pins on the P2 connector, both the VME processor board and the MVME761 transition module multiplex and demultiplex some of the P2 signals. This function, called P2MX is transparent to the software and the user.

Four pins are used for the signal multiplexing:

- ❑ MXCLK
- ❑ MXSYNC#
- ❑ MXDO
- ❑ MXDI

Sixteen time slots are defined and allocated. The signal multiplexing sequences are listed in [Table 3-1](#).

Table 3-1. P2 signal multiplexing sequence

MXDO (from the MVME260x/MVME270x/MVME360x/ MVME460x)		MXDI (from the MVME761)	
Time Slot	Signal Name	Time Slot	Signal Name
0	RTS3	0	CTS3
1	DTR3	1	DSR3/MID1
2	LLB3/MODSEL	2	DCD3
3	RLB3	3	TM3/MID0
4	RTS4	4	RI3
5	DTR4	5	CTS4
6	LLB4	6	DSR4/MID3
7	RLB4	7	DCD4
8	IDREQ#	8	TM4/MID2
9	DTR1	9	RI4
10	DTR2	10	RI1

Table 3-1. P2 signal multiplexing sequence

MXDO (from the MVME260x/MVME270x/MVME360x/ MVME460x)		MXDI (from the MVME761)	
Time Slot	Signal Name	Time Slot	Signal Name
11	Reserved	11	DSR1
12	Reserved	12	DCD1
13	Reserved	13	RI2
14	Reserved	14	DSR2
15	Reserved	15	DCD2

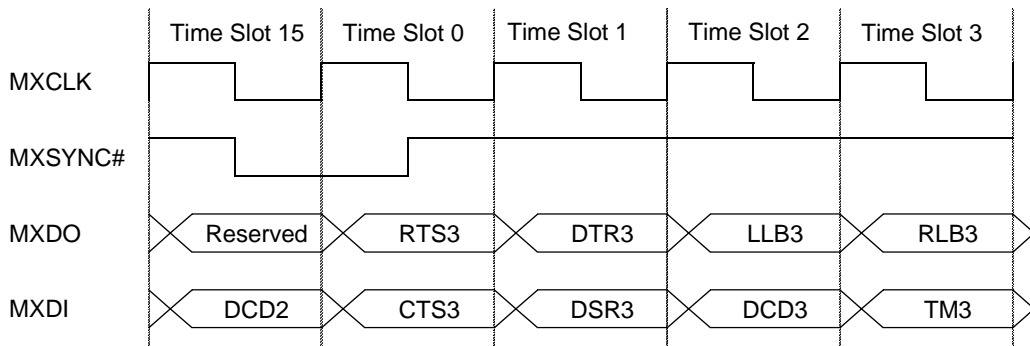

MXCLK is the 10MHz bit clock for the time-multiplexed data lines, MXDO and MXDI.

MXSYNC# is asserted for one bit time at Time Slot 15 by the MVME260x, MVME270x, MVME360x, or MVME460x. MXSYNC# is used by the MVME761 transition module to synchronize with the VME modules.

MXDO is the time-multiplexed output line from the main board and MXDI is the time-multiplexed line from the MVME761 transition module. A 16-to-1 multiplexing scheme is used with a 10MHz bit rate.

MXSYNC# is clocked out using the falling edge of MXCLK and MDXO is clocked out with the rising edge of the MXCLK. MXDI is sampled at the rising edge of MXCLK (the transition module synchronizes MXDI with MXCLK's rising edge).

The timing relationships among MXCLK, MXSYNC#, MXDO, and MXDI are illustrated in [Figure 3-4](#).

Figure 3-4. Multiplex signal timing chart

Serial Interface Module Circuitry

Each Serial Interface Module has a 60-pin connector that provides all signal and power connections to the MVME761 transition module.

TTL-level signals

All TTL-level signals, with the exception of data and clocks, are active low. The pullup resistors on the MVME761 transition module drive all TTL inputs to the SIM to a known logic level.

SIMs

The SIMs have surge suppression circuitry for all port signals going to the external connector. This consists of a series resistor and a dual 15V clamp diode to chassis ground. All series resistors are 100 ohms except on the EIA-530 balanced drives, which use 10 ohm series resistors.

- **EIA-232-D** SIMs employ MC145406 ICs as line transmitters to convert the TTL output signals from the MVME260x, MVME270x, MVME360x, or MVME460x module to EIA-232-D voltage levels. As line receivers, the MC145406 ICs convert the EIA-232-D input signals to TTL voltage levels which are sent to the VME module.
The MC145406 transceiver IC requires a series diode on the +12V supply and a clamp diode to logic ground on the -12V supply. The diodes are located on the transition module rather than on the SIM due to space limitations.
- **EIA-530** and **X.21** SIMs employ AM26C31CD ICs as transmitters to convert the TTL output signals from the MVME260x, MVME270x, MVME360x, or MVME460x module to balanced signals. As line receivers, the AM26C32CD ICs convert the balanced input signals to TTL signals which are sent to the VME module.
- **V.35** SIMs employ LTC1345T ICs as transmitters to convert the TTL output signals from the MVME260x, MVME270x, MVME360x, or MVME460x module to balanced signals. As line receivers, the LTC1345R ICs convert the balanced input signals to TTL signals which are sent to the VME module.

For all port interfaces, the SIMs support the transmitter signal element timing as either input or output signals.

Port Configuration Diagrams

COM1 and COM2 asynchronous serial ports

The asynchronous serial port (COM1 and COM2) configuration is shown in [Figure 3-5](#).

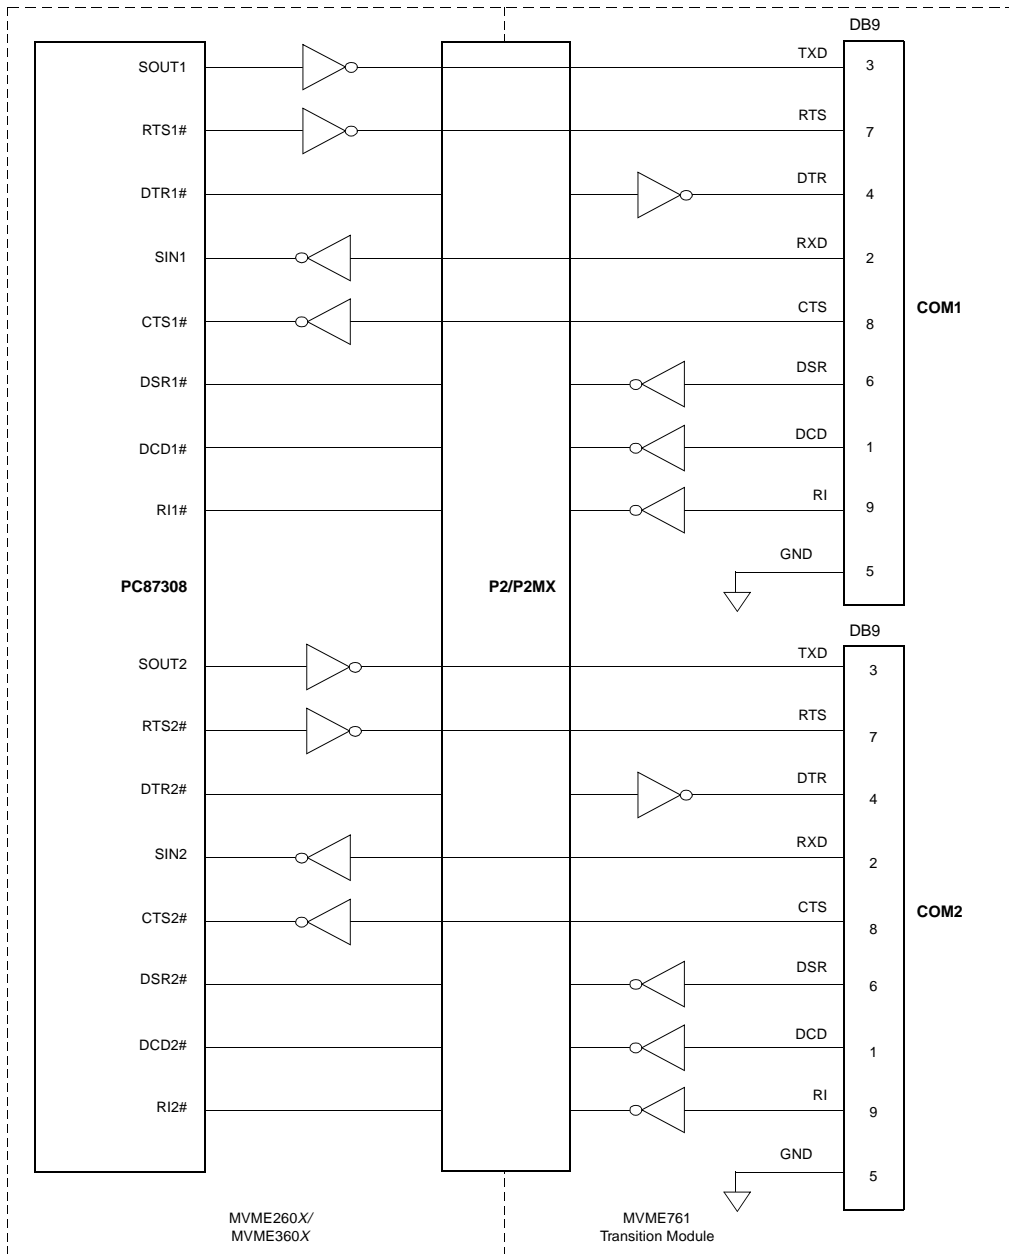

Figure 3-5. EIA-574 DTE port configuration (COM1 and COM2)

Asynchronous/Synchronous Serial Ports

The asynchronous/synchronous serial port (Port 3 and Port 4) interface configuration diagrams are on the following pages.

Connector Pin Assignments

4

Introduction

This chapter provides the pin assignments for the P2 connector and front panel port connectors on the MVME761 transition module, as well as for the SCSI and PMC I/O connectors on the P2 adapters.

MVME761 Transition Module Connectors

P2 connector

Signaling and power from the MVME260x, MVME270x, MVME360x, and MVME460x are received through connector P2, a 64-pin DIN connector. Because the P2 adapter reroutes some of the signals, connector P2 on the MVME761 transition module is not pin-for-pin compatible with connector P2 on the MVME260x, MVME270x, MVME360x, and MVME460x modules.

The pin assignments and signal mnemonics for the MVME761 transition module P2 connector are listed in the following table.

Table 4-1. MVME761 P2 connector pin assignments

Row A Pins		Row C Pins	
Pin	Signal	Pin	Signal
1	C- (R- for RJ-45 J9)	1	C+ (R+ for RJ-45 J9)
2	T-	2	T+
3	R-	3	R+
4	+12VF	4	PRSTB#
5	GND	5	PRD0
6	PRD1	6	PRD2
7	PRD3	7	PRD4

Table 4-1. MVME761 P2 connector pin assignments

32	MDO	32	MDI

Asynchronous serial port connectors (J5/J6)

The interface for the asynchronous serial ports, COM1 and COM2, is provided with two standard DB9 connectors, J5 and J6. The connector shields for these ports are tied to chassis ground. The pin assignments and signal mnemonics for these connectors are listed in [Table 4-2](#).

Table 4-2. COM1 and COM2 pin assignments

Pin	Signal
1	DCD
2	RXD
3	TXD
4	DTR
5	GND
6	DSR
7	RTS
8	CTS
9	RI

Asynchronous/Synchronous serial port connectors (J7/J8)

The interface for the asynchronous/synchronous serial ports 3 and 4 is provided by two HD-26 connectors, J7 and J8. The connector shields for these ports are tied to chassis ground.

The pin assignments and signal mnemonics for serial ports 3 and 4 are listed in the following tables.

Table 4-3. Serial port 3 pin assignments

Pin	Signal	Pin	Signal
1	No Connect	14	SP3_P14

12	SP4_P12	25	TM4
13	SP4_P13	26	No Connect

Parallel I/O port connector (J4)

The interface for the parallel port is a standard IEEE P1284-C, 36-pin connector, J4. The functionality of each signal depends on the mode of operation of this bidirectional Parallel Peripheral Interface. Refer to the IEEE P1284 D2.00 Standard for a complete description of each signal function. The connector shield is tied to chassis ground.

The pin assignments and signal mnemonics for this connector are listed in [Table 4-5](#).

Table 4-5. Parallel I/O connector pin assignments

Ethernet Connector (J9)

The 10Base-T/100Base-TX Ethernet interface is a RJ-45 connector, J9. The connector shield is tied to chassis ground. The pin assignments and signal mnemonics for this connector are listed in [Table 4-6](#).

Table 4-6. 10Base-T/100Base-TX pin assignments

P2 Adapter Connectors

3-Row P2 adapter (J2)

The 8-bit SCSI connector on the 3-row DIN backplane P2 Adapter is a 50-pin connector, J2. The pin assignments and signal mnemonics for this connector are listed in [Table 4-7](#).

Table 4-7. 8-bit SCSI connector (3-Row P2 adapter)

MVME761

 board size 1-9

 cables 1-8

 circuitry 3-1

 component layout 1-3

 connectors 1-7, 4-1

 description 1-1

 installation 2-5

 pin assignments (P2) 4-1

 specifications 1-9

O

operating temperature 1-9

output to P2 connector (MVME761) 4-9,
 4-13

P

P2 Adapter 1-2

P2 adapter connectors 4-8 to 4-14

P2 adapter, 3-row 1-5

P2 adapter, 5-row 1-6

P2 adapter, connectors 1-7

P2 adapter, installation 2-5

P2 adapter, pin assignments 4-8

parallel port 1-1

parallel port pin assignments 4-6

parallel port signals 4-6

part numbers

 P2 adapter, 3-row 1-5

 P2 adapter, 5-row 1-6

 SIM 1-4

pin assignments 4-1

 Ethernet connector J9 4-7

 P2 connector (MVME761) 4-1

 parallel port J4 (MVME761) 4-6

 PMC I/O, J3 (P2 adapter 5-row) 4-12

 SCSI connector J2 (P2 adapter 3-row)
 4-8

 SCSI, J1 (P2 adapter 5-row) 4-10

 serial port (MVME761) 4-3

 serial port 3/4 (MVME761) 4-4

 VME connector J4 (P2 adapter 5-row)
 4-13

 VME connector, J3 (P2 adapter 3-row)
 4-9

pin compatibility for P2 connectors 4-1

PMC I/O 1-6

PMC I/O connector (P2 adapter 5-row) 4-12

port configurations 3-8, 3-9

port connectors, location 1-7

port interfaces 1-4

port signals 4-3, 4-6

power requirements 1-9

power source 3-1

procedures

 cabling the transition module 2-7

 installing SIMs 2-2

 installing transition module and P2
 adapter 2-6

product description 1-1

R

relative humidity 1-9
RF emissions 1-9
running SCSI devices 1-5

S

SCSI connector 4-10
SCSI connector pin assignments 4-8, 4-10
SCSI connector, 3-row (P2 adapter) 4-8
SCSI connector, 5-row (P2 adapter) 4-10
SCSI devices 1-5
SCSI port 1-5
Serial Interface Module, see SIM
serial port
 configurations 3-8, 3-10 to 3-26
 signals 4-3
serial port 3 pin assignments 4-4
serial port 4 pin assignments 4-4
serial ports 1-1, 1-2, 1-4, 3-1
series resistors 3-7
signal multiplexing 3-1
signal transmitters 3-7
signals, TTL-level 3-7
SIM 1-1
 circuitry 3-1, 3-7
 description 1-4
 installation 2-2
 part numbers 1-4
specifications 1-9
static protection 2-1, 2-5
storage temperature 1-9
surge suppression 3-7

T

temperature 1-9
TTL-level signals 3-7

U

unpacking 2-1

V

V.35, circuitry 3-7
VMEmodules, supported 1-1

X

X.21, circuitry 3-7
